Appendix C:
Transportation Impact Assessment

Introduction

The purpose of this memorandum is to outline the previous transportation analysis completed in accordance with New York City Environmental Quality Review (CEQR) requirements and to present the approach and results for the transportation analysis in accordance with the National Environmental Policy Act of 1969 (NEPA).

The Project would redevelop the site located at the northwest corner of the intersection of Lexington Avenue and 42nd Street with a new, mixed-use office and hotel building with retail, public space, and large-scale transit and public concourse improvements. Commodore Owner LLC is seeking financing through the Railroad Rehabilitation and Improvement Financing (RRIF) loan program, which is administered by the Build America Bureau within the United States Department of Transportation (Bureau). As a result, the Project is subject to the provisions of NEPA. On behalf of the Bureau, the FTA is serving as the lead federal agency for the NEPA review.

The Project was previously reviewed pursuant to New York City's Uniform Land Use Review Procedure and the potential environmental impacts were reviewed in accordance with CEQR. A CEQR Draft Environmental Impact Statement (DEIS) and Final EIS (FEIS) were completed in 2021. Where appropriate, the analysis described below references the CEQR transportation analysis for additional context. This memo builds off the previous CEQR analysis with a focus on capacity within the transportation system and analyzes whether the additional traffic, pedestrian and transit volumes under the Build Alternative would materially change the travel experience of visitors and commuters compared to conditions under the No Build Alternative.

The previous CEQR analysis was based on a "No Action" condition under which the Project site would be redeveloped as-of-right under New York City zoning regulations. The No Action Alternative used in the CEQR analysis was determined by local authorities with extensive experience conducting environmental reviews in New York City. The analysis involved a comprehensive and detailed analysis of the proposed development to identify potential impacts on traffic operations and mobility, public transportation facilities and services, pedestrian elements and flow, safety of all roadway users (pedestrians, cyclists, transit users and motorists), on- and off-street parking, and/or goods movement. The analysis underwent a lengthy review process and was subsequently approved by the New York City's Department of City Planning, New York City Department of Transportation, the New York City Council and other coordinating agencies.

Alternatives

The analysis described in this memo is a site-focused screening; therefore, the elements of the No Build Alternative and Build Alternative described below are those that affect the trip generation attributable to each alternative. In each alternative, the background

transportation network would be the same – it would include the existing network plus any planned transportation improvements within ¼ mile of the Project Site expected to be in place when the Project opens. It would also include trips generated by development projects that are in the planning or construction phases and expected to be constructed by the time the Project opens.

No Build Alternative

The No Build Alternative assumes continued operation of the existing 1,300 room hotel with 21,000 square feet of ground floor retail space.

Build Alternative

In the Build Alternative, the Project Sponsor proposes to acquire the project site, demolish the existing Hyatt hotel, and construct a new, mixed-use office and hotel building with retail, public space, and large-scale transit and public concourse improvements. The proposed building would provide approximately 2.9 million gsf of mixed-use office, hotel, and public space including 2,165,451 gross square feet (sf) of office space, 200 hotel rooms, and 3,271 sf of local retail space.

The Build Alternative would include several public concourse, transit and public space improvements to enhance circulation and reduce congestion within the Grand Central Terminal transportation network. These elements are "betterments" that are a condition of the Project's development approvals. Performance of the transit improvements by developer is required as a condition of the New York City zoning approvals and would be implemented pursuant to the terms of agreements with the Metropolitan Transportation Authority (MTA) as the agency charged with the management of and the making of improvements to its transportation facilities.

In connection with the proposed development, the Build Alternative would provide the following transit circulation and public space betterments at Grand Central Terminal, the Grand Central – 42nd Street subway station, and on the project site:

- The subway entrance at East 42nd Street would be redesigned and expanded. Turnstiles would be relocated to street level, and a new diagonal staircase leading to the subway would ease the flow of foot traffic. A new elevator adjacent to the stair would provide a more direct ADA connection to the subway mezzanine. The elevator located at the entrance to the 42nd Street Passage would be removed, and in its place, the historic entrance would be restored. A new designated subway entrance would be constructed on the project site to provide a direct connection to East 42nd Street from the subway and help ease crowding and backups at the entrances.

- A new transit hall of approximately 5,300 sf containing retail, information screens and booths, and connections to Grand Central Terminal would be constructed at the ground floor level on the western side of the project site. The transit hall would work in tandem with the existing 42nd Street Passage and expanded subway entrance to increase pedestrian throughput.
- Improvements to the subway entrance on Lexington Avenue and below-grade mezzanine would be constructed to bring light and air into the subway mezzanine and provide a larger, covered at-grade subway entrance. These improvements would also help to ease crowding and backups at the entrances. The stairs located near the northwest corner of Lexington Avenue and East 42nd Street that provide access from Lexington Avenue down to the mezzanine level of the subway station would be realigned and relocated further north.
- The building would be set back from Lexington Avenue to allow for a minimum five-foot increased sidewalk widths on Lexington Avenue and East 42nd Street.
- The Lexington Passage entrance would be redesigned to make it legible and inviting to pedestrians. The Passage would be refinished, and its ceiling height would be increased from approximately 9 feet 6 inches to as high as 18 feet for most of its length.
- Girders would be removed from the subway mezzanine level to improve circulation and enhance sightlines.
- A "Short Loop Connection" would be constructed through adaptive reuse of an existing, decommissioned Metro-North loop track tunnel to create a pedestrian connection between the Long Island Rail Road Grand Central Madison station and the lower-level Metro-North trains and subway mezzanine level.
- The open space proposed on the west side of the building, the Grand Central Terrace, would provide new visibility of the southeast corner of Grand Central Terminal. The terrace would provide trees, planting, seating, and skylights that bring light to the transit hall below. Additionally, a sidewalk expansion along the Grand Central Terrace adjacent to the Park Avenue Viaduct would measure 142 feet long by 8.5 feet wide.
- The open space proposed on the east side of the building, the Chrysler Terrace, would provide an overlook onto Lexington Avenue and East 42nd Street, and a unique vantage point for viewing the surrounding landmarks. The terrace would feature trees, plantings, and multiple types of seating.
- The open space proposed on the north side of the building, the Graybar Terrace, would feature retail use, fixed and movable seating, and flexible space.

Traffic

Existing Conditions

The Project is located in one of the most transit-rich environments in New York City, adjacent to Grand Central Terminal, which features commuter rail access to Metro-North Railroad (MNR) and Long Island Rail Road (LIRR), and located above the Grand Central-42nd Street subway station. The Project is also served by multiple bus lines and is located within a ½-mile from three other subway stations. Based on the 2012-2016 American Community Survey[1] reverse journey to work data for the surrounding census tracts (78, 80, 88, 90, 92, 94, 98, 100 and 102), 8.4 percent worker trips to this area drove while 80.2 percent of worker trips took transit.

The transportation analysis in the 2021 CEQR FEIS relied on traffic data collected before the advent of the COVID-19 pandemic in early 2020. Since that data were collected, two major background projects located near the Project were completed and introduced new trips to the study area. The One Vanderbilt project, an approximately 1.7 million sf commercial development located one block west of the Development Site, was completed in late 2020. In addition, the Long Island Rail Road's East Side Access project was completed in early 2023, providing a new commuter rail connection at Grand Central Terminal. In addition, the New York City Department of Transportation implemented projects focused on improving pedestrian and bus operations along key roadways in the traffic network, including along East 42nd Street and Lexington Avenue; these projects expanded the bus lanes but reduced the number of travel lanes available to general vehicle traffic. Lastly, travel patterns have changed following the COVID-19 pandemic.

Traffic data collection was collected in November 2024 at the 15 intersections analyzed in the 2021 CEQR FEIS during the weekday AM, midday, and PM peak hours. The current conditions volumes were compared to the 2019 existing conditions volumes analyzed in the 2021 CEQR FEIS, and it was determined that there was an approximately 24 percent decrease in the traffic volumes at these 15 intersections during the weekday AM and midday peak hours, and an approximately 20 percent decrease in the weekday PM peak hour. It is assumed that these decreases are due to changes in travel patterns following the COVID-19 pandemic.

On January 5, 2025, after the traffic counts were conducted, New York City enacted the Central Business District Tolling Program which introduced a congestion pricing fee for motorists traveling in the Manhattan CBD, an area which includes the roadways within the

1 The latest American Community Survey reverse journey to work dataset is for the years 2017 through 2021 and had comparable auto (8.9 percent) and transit (80.5 percent) as the 2012 - 2016 dataset. However, the 2017 – 2021 dataset includes survey data during the quarantine period of the COVID-19 pandemic and therefore were not used.

traffic and pedestrian study areas. This program has resulted in a reduction in traffic volumes in the study area[2], and potentially increased subway ridership as some motorists would choose to take mass transit instead of driving due to this program.

No Build Alternative

As the No Build Alternative is the existing hotel and accessory retail spaces, it is assumed that no additional trips would be generated compared to existing conditions. Using travel demand factors found in the *2021 Citywide Environmental Quality Review Technical Manual (CEQR Technical Manual)*, survey data provided by NYCDOT, and assumptions used from other environmental review documents, it is estimated that the existing uses generates 441 vehicle trips during the weekday AM peak hour, 348 vehicle trips during the weekday midday peak hour, and 395 vehicle trips during the weekday PM peak hour. These vehicle trips were assigned through the roadway network to estimate the magnitude of vehicle trips at the 15 intersections analyzed in the 2021 CEQR FEIS (see Table 1 and attached trip generation calculations). Existing trips were assigned to enable a comparison of the trips attributable to the development on the Project Site in the No Build Alternative relative to the Build Alternative.

Table 1 Vehicle Trip by Intersection due to the Existing Hotel and Retail

Intersection	Weekday AM Peak Hour	Weekday PM Peak Hour
Second Avenue and East 40th Street	38	35
Second Avenue and East 42nd Street	36	35
Third Avenue and East 40th Street	85	73
Third Avenue and East 42nd Street	111	96
Lexington Avenue and East 40th Street	66	59
Lexington Avenue and East 42nd Street	209	175
Lexington Avenue and East 43rd Street	108	88
Lexington Avenue and East 44th Street	109	90
Lexington Avenue and East 45th Street	114	91
Lexington Avenue and East 46th Street	119	94
Park Avenue and East 40th Street	64	55
Madison Avenue and East 42nd Street	198	170
Fifth Avenue and 42nd Street	198	170
Sixth Avenue and West 42nd Street	199	171
Broadway and West 42nd Street	133	115

2 Per the MTA, the congestion pricing program has resulted in a reduction of 8 to 14 percent per month during the period of January 2025 through June 2025.

Build Alternative

Trip generation projections were prepared for the Build Alternative using the travel demand factors found in the *2021 CEQR Technical Manual*, survey data provided by NYCDOT, and assumptions used from other environmental review documents (see attached trip generation calculations). The Build Alternative would generate an increase of 176 vehicle trips during the weekday AM peak hour and 84 vehicle trips during the weekday PM peak hour compared to the No Build Alternative. However, the Build Alternative would be expected to generate fewer vehicle trips compared to the No Build Alternative during the weekday midday peak hour (a reduction of 29 vehicle trips). Therefore, the Build Alternative would not result in traffic impacts during the weekday midday peak hour.[3]

A trip assignment was conducted for the weekday AM and PM peak hours to determine, once distributed, whether the increase in vehicle trips at any individual intersection would be considered to be an adverse impact. Tables 2 and 3 below show the vehicle trip increment for the Build Alternative compared to the No Build Alternative at 15 intersections within the study area for the weekday AM and PM peak hours, respectively. The Build Alternative would result in decreased traffic volumes at six intersections during the weekday AM peak hour and at nine intersections during the weekday PM peak hour due to the difference in travel patterns between the No Build Alternative and Project uses.[4] At the other intersections, the increase in vehicle trips would be minimal to modest, with the largest increase occurring at the intersection of Second Avenue and East 40th Street; this intersection would experience an increase of 69 vehicle trips during the weekday AM peak

3 The trip generation for the Build Alternative differs from the CEQR Action Alternative for three reasons: (1) the current program for the Build Alternative includes less retail and hotel and more office square footage, which results in fewer trips than the program analyzed in CEQR; (2) this analysis uses the latest accepted New York City rates; and (3) this analysis reflects an analytical framework comparing the current program to the existing building/uses rather than a redeveloped building. As the generated trips are lower than those in the CEQR analysis, it serves as confirmation that the CEQR analysis represents a "worst case" scenario.

4 The hotel use would be the predominant trip generating use for the No Build Alternative, and the vast majority of these trips are taxi trips that would travel directly to the site (to pick-up or drop-off hotel guest) which results in higher intensity of trips near the site. In comparison, vehicular trips related to office use (the predominant trip generating use for the Build Alternative) would be primarily made up of auto trips that would travel directly to nearby off-site parking facilities (i.e., office workers would park off-site and walk to the site) which would reduce the magnitude of vehicle trips at intersections near the site and en route/departing from the site. In addition, the origin-destination patterns are different between these two uses – hotel trips were primarily assigned to local attractions within Manhattan (approximately 90 percent was assumed, per the 2021 CEQR FEIS) whereas office trips would mostly originate from outside of Manhattan (approximately 92 percent, per the 2021 CEQR FEIS).

hour. The level of increase amounts to 1.2 additional vehicles per minute at the intersection, or 1.8 additional vehicles during each traffic signal cycle (the traffic signal cycle length is 90 seconds). This increase would not materially change the motorist's experience.

Table 2 Vehicle Trip Increment by Intersection – Weekday AM Peak Hour

Intersection	No Build Alternative	Build Alternative	Increment
Second Avenue and East 40th Street	38	107	69
Second Avenue and East 42nd Street	36	86	50

Sixth Avenue and West 42nd Street	171	105	-65
Broadway and West 42nd Street	115	79	-36

Pedestrians

Existing Conditions

The Project is located in the East Midtown area which is a commercial business district characterized by high levels of pedestrian activity. Pedestrian counts were conducted at the 15 pedestrian elements (i.e., crosswalks, sidewalks and corners) analyzed in the 2021 CEQR FEIS in November 2024. The pedestrian counts show that there has been a decrease in pedestrian volumes compared to the 2019 existing conditions – approximately 16 percent lower during the weekday AM peak hour, 11 percent during the weekday midday peak hour and 7 percent during the weekday PM peak hour. As a result, there is additional available capacity in the system compared to pre-COVID conditions.

No Build Alternative

As the No Build Alternative is the existing hotel and accessory retail spaces; it is assumed that no additional trips would be generated compared to existing conditions.

Build Alternative

The Build Alternative would improve the pedestrian environment by widening the sidewalks along the site's Lexington Avenue and East 42nd Street frontages by a minimum of five feet which would improve pedestrian conditions. Assuming a pedestrian flow rate of 10 pedestrians per minute per foot, the additional five feet in sidewalk space would provide an additional capacity of 3,000 pedestrians in an hour.[5] Along Lexington Avenue, the existing pedestrian space (raised curb plus painted asphalt space) is 22 feet wide and would be expanded to at least 27 feet. Along East 42nd Street, the existing sidewalk is 20 feet and would be expanded to at least 25 feet.

The Build Alternative is estimated to generate an increase of 991 pedestrian trips in the weekday AM peak hour compared to the No Build Alternative, 3,298 pedestrian trips in the weekday midday peak hour and 475 pedestrian trips in the weekday PM peak hour (pedestrian trips consider bus and walk-only trips plus walk trips between parking and the project site, but does not include subway and rail trips that would occur entirely within Grand Central Terminal and the Grand Central-42nd Street subway station).

Table 4 shows the increase in pedestrian trips distributed along the project site's two frontages where project-generated pedestrian trips would be most concentrated. These trips would be dispersed through the roadway network to attractions in the area, such as

5 Per the Highway Capacity Manual, the flow rate at level of service letter (LOS) grade D is 10 to 15 pedestrians per minute per foot. LOS D is a condition where pedestrian would have their normal walking speed restricted and represents conditions in a central business district. LOS D is a typical pedestrian condition in Midtown Manhattan.

transit stops and commercial establishments, and the level of pedestrian activities would be lower at pedestrian elements further away from the project site. During the weekday AM and PM peak hours, the pedestrian increases along the two sidewalks are modest (or in the case for the Lexington Avenue frontage sidewalk during the weekday PM peak, would result in a modest decrease). The increase in pedestrian trips would be highest during the weekday midday peak hour due to office midday trips (e.g., office workers going to lunch, running errands, etc.). The increases in pedestrian volume would be accommodated by the additional pedestrian space provided by the Build Alternative. Specifically, the highest increase of pedestrian trips along the Project's frontage sidewalk (1,394 pedestrians in an hour) could be accommodated by the increased capacity of 3,000 pedestrians in an hour due to sidewalk widening proposed by the Build Alternative. Therefore, this increase would not materially change the pedestrian experience in a negative way nor does it change the context of the study area's pedestrian environment.

Table 4 Pedestrian Increment Along Project Site Frontages

	Weekday AM Peak Hour		Weekday Midday Peak Hour		Weekday PM Peak Hour	
Sidewalk	**Increment**	**Existing Volume**	**Increment**	**Existing Volume**	**Increment**	**Existing Volume**
Lexington Avenue west sidewalk between East 42nd and East 43rd Streets	100	3,667	775	2,440	-36	4,268
East 42nd Street north sidewalk between Park Avenue and Lexington Avenue	598	3,111	1,394	2,274	329	2,445

Subways

Existing Conditions

Per MTA's data, in 2024 the Grand Central-42nd Street subway station had an average weekday ridership of 108,547 riders. This is an approximately 31 percent decrease from the average weekday ridership of 157,273 riders in 2019 prior to the COVID-19 pandemic. In the 2021 CEQR FEIS analysis, the total in/out volumes at the subway station's fare control areas in the 2019 existing conditions was 48,185 trips in the AM peak hour and 43,848 trips in the PM peak hour.

No Build Alternative

As the No Build Alternative is the existing hotel and accessory retail spaces, it is assumed that no additional trips would be generated compared to existing conditions. In addition, the No Build Alternative would not include any of the circulation improvements within the Grand Central-42nd Street subway station, the Lexington Avenue Passage, or the 42nd Street Passage that are part of the Build Alternative.

Build Alternative

The Project is located above of the Grand Central-42nd Street subway station and adjacent to Grand Central Terminal. The Build Alternative therefore creates opportunities to introduce transit and public realm improvements that would enhance the passenger circulation conditions in the subway station, and connections between Grand Central Terminal and the subway station. These improvements would provide additional vertical circulation and fare control capacity at the Fare Control Area (FCA) 238, which is the primary fare control area in the subway station. The 2021 CEQR FEIS assumed that due to existing constraints at FCA 238, some riders were diverted to other fare control areas making circuitous paths through Grand Central Terminal and the subway station. With the additional capacity provided as part of the Project, it is assumed that travel patterns would be redistributed to make greater use of FCA 238.

These improvements would also assist in alleviating the congestion introduced by the opening of the East Side Access project which provides LIRR service to this station. Previous analyses estimated that Fare Control Area (FCA) 238 in particular would experience a larger number of MNR and LIRR riders.

A summary of the transit improvements is provided below in Table 5.

The Build Alternative is estimated to generate an increase of 2,141 subway trips in the AM peak hour and 1,778 subway trips in the PM peak hour compared to the No Build Alternative. Per the subway station ridership data, there was an approximate 31 percent decrease in ridership between 2019 and 2024 which equates to approximately 14,900 trip reduction during the AM peak hour and approximately 13,500 trips during the PM peak hour. Therefore, it is expected the Build Alternative-generated subway trips could be sufficiently accommodated by the existing subway station elements (even before accounting for the additional transit capacity provided by the Build Alternative).

If ridership levels return to pre-COVID conditions, the increase in Build Alternative-generated trips would represent a modest increase in overall subway ridership. The MTA developed a ridership model in 2021 which was used in the 2021 CEQR FEIS subway station analysis. In total, the 2021 CEQR FEIS projected that subway ridership volumes at the Grand Central-42nd Street subway station's FCAs would recover from the COVID-19 pandemic; ridership would be 59,886 trips during the AM peak hour and 55,100 trips during the PM

peak hour. The Build Alternative would account for about four percent of the station ridership during the AM peak hour and about five percent of the station ridership during the PM peak hour. The Build Alternative would contribute a modest increase in subway ridership, therefore, the increase would not materially change the subway rider's experience.

The proposed transit improvements would enhance the subway rider's experience by increasing capacity at subway station elements at FCA 238. This change, plus the "Short Loop connection," would change travel patterns and reduce travel times for subway riders walking through the subway station and Grand Central Terminal. Within the subway station, the redesign of FCA R240 and the paid zone in the mezzanine level through removal of girders and back-of-house spaces would improve circulation and accessibility at the mezzanine level to the platform stairs and escalators. As the Build Alternative-generated subway trips are modest relative to the total trips using the subway station's facilities and the Build Alternative would introduce transit and public realm improvements to the subway station, the Build Alternative would not adversely affect the context of the study area environment or subway station experience.

Table 5 Summary of Transit Improvements

Area	Improvement	Benefits
FCA R238	New subway entrance	Provides direct connection between East 42nd Street and subway access
	Relocate turnstiles to street level	Alleviates congestion points at the subway mezzanine
	New street-to-mezzanine stair	Provides additional vertical circulation capacity and alleviates congested stairs and escalators
	Additional turnstile and vertical circulation capacity	Streamlines walking paths for riders between Grand Central Terminal and subway service; riders' desire path is through FCA R238 but some riders currently use other fare control areas due to congestion at this fare control area
New Transit Hall	Provide transit hall with retail and information screens/booths	Expands pedestrian circulation area through the Grand Central Terminal's 42nd Street Passage
FCA R240	Additional turnstiles	Provides additional turnstile capacity
	Realigned Lexington Avenue street-to-mezzanine stair	Relocated stairway would be in a larger, covered, at-grade subway entrance along Lexington Avenue
	Removal of girders and back-of-house spaces	Provides better visual and physical connection to mezzanine-to-platform stairs, and improves entry and exit circulation at this fare control area
Subway mezzanine level	Remove girders	Provides more circulation space and enhances sightlines in the mezzanine level

Table 5 Summary of Transit Improvements

Area	Improvement	Benefits
Short Loop connection	Provide connection for rail riders to subway	Creates a new connection that provides direct access for commuter rail riders between the Grand Central Terminal lower level to the subway; riders would bypass needing to travel to the upper level of Grand Central Terminal and accessing the subway station via FCA R238, reducing their walking distances
